

Final project

MAL2 Autumn 2025

In your final project in MAL2, you must create a **machine learning system** involving at least one **neural network** as well as an **ethical impact assessment** (AIEIA Light) of the system.

You are free to choose which problem you want to work with, as long as you hand in a notebook with

- output (all cells must be run)
- relevant comments describing your data, problem, approach, experiments, findings, performance metrics, etc.
- at least one neural network used to solve your problem*
- an ethical impact assessment (AIEIA Light) of your machine learning system
- at least four interesting figures or animations with relevance to the assignment

*If you choose to use a **pretrained model** (e.g., a transformer), you must also **build a model from scratch** to solve your chosen problem and **compare the two approaches**.
