

AIEIA Light

Proportionality & Do No Harm

1. Who are the intended users of your system, and what is their level of technical skill?
2. Is the AI system intended to be deployed in a critical sector such as energy, transportation, water, health, digital infrastructure, finance, electoral systems, law enforcement or similar?
3. Is the AI system, including the core model, developed for this specific aim or objective or is it built upon an existing model (e.g., GPT)? If so, please list relevant dependencies and corresponding risks which may have an impact on the ethical impact assessment.
4. Has careful consideration been given to non-AI options which may be used to achieve the same goal? If so, why is the option involving an AI system favored?
5. Could other actors adapt the system for unethical uses, such as social scoring or mass surveillance?
6. Will your system make decisions that could impact critical outcomes like someone's health, safety, or legal status? (e.g., setting prison sentences or determining medical treatments).
7. Could the AI system and its application impact fundamental human rights (e.g., human dignity, freedom of expression, fair trial)?

Safety & Security

8. If the training data or data being processed by the AI system were poisoned or corrupted, or if your system was manipulated, what would the consequences be?

Right to Privacy & Data Protection

9. If your data is people-centric: Is it anonymized?
10. Are users made aware of how their data is handled?

Fairness & Non-Discrimination

11. Does the data you're using for your project reflect a diverse range of users? If not, how might this affect the fairness of the AI system?
12. Has the algorithm been tested across diverse user groups? Were there differences in accuracy or other performance metrics between groups? Did any results indicate potential bias or discriminatory effects?

Human Oversight & Determination

13. Can users challenge or correct the AI's output? For example, if your AI system misclassifies something or gives an incorrect recommendation, how can the user intervene?

Accountability & Responsibility

14. In your project, who do you think should be responsible for decisions made by the AI?
15. How would you assign accountability if the system makes a harmful or incorrect decision?

Transparency & Explainability

16. Is there a risk that individuals impacted by the AI system are not made fully aware of when a decision that impacted them was informed by or made on the basis of an AI system or AI algorithms?
17. Can you clearly explain how the AI system makes its decisions? If a user asks, could you provide a simple, understandable explanations?

Based on the answers to the questions above, what actions do you recommend?
